Amendments to the Specification:

Please replace the paragraph on page 6, beginning at line 27, that reads "(fix "green" to blue.....", erroneously entered by the last amendment, with the following:

--Therefore, the predetermined value that is used to adjust the pixel value may not be a constant. For example, the value may change differently in each channel. As described above, the resulting pixels in the example can be changed to values of 138 in the red channel (R'), 125 in the green channel (G'), and 192 in the blue channel (B'). In this case, the red channel has been adjusted upward, the green channel has been adjusted downward, and the blue channel has not been changed. Also, the predetermined value may be a different value according to the original pixel value. For example, if the original value (R) is 128 in the red channel, the modified value may be increased by 10 to 138 (R'). However, if the original value (R) is 225 in the red channel, the modified value may be decreased by 10 to 215 (R'). This adjustment may be determined by well known look up table techniques.--
